**Table 4.14****The Result of The Correlation between Spatial-Visual and Proposal writing Score**

		Spatial-Visual	Proposal writing Score
Spatial-Visual	Pearson Correlation	1	.077
	Sig. (2-tailed)		.497
	N	79	79
Proposal writing Score	Pearson Correlation	.077	1
	Sig. (2-tailed)	.497	
	N	79	79

The table above shows that the correlation between spatial-visual intelligence and proposal writing score are described by Pearson correlation = 0,077 and Sig. 0,497. It describes that the variables are negatively correlated. Consequently, there is no significance correlation between spatial-visual intelligence and proposal writing score.

**Table 4.16****The Result of The Correlation between Intrapersonal and Proposal writing Score**

		Intrapersoanal	Proposal writing Score
Intrapersoanal	Pearson Correlation	1	.149
	Sig. (2-tailed)		.189
	N	79	79
Proposal writing Score	Pearson Correlation	.149	1
	Sig. (2-tailed)	.189	
	N	79	79

For the last correlation is between intrapersonal intelligence and proposal writing score. The table above shows that Pearson correlation = 0,149 and Sig. (2-tailed) = 0,189. It shows that the variables are negatively correlated. Consequently, there is no significance correlation between intrapersonal intelligence and proposal writing score.

Based on the analysis above, it describes that the result of multiple intelligence shows a positively correlated with proposal writing for linguistic intelligence (Pearson correlation = 0,248, Sig. (2-tailed) = 0,027), bodily-kinesthetic intelligence (Pearson correlation = 0,273, Sig. (2-tailed) = 0,015)

intelligence gets Pearson correlation = 0,193. The fifth rank is intrapersonal. This intelligence attains Pearson correlation = 0,149. The sixth rank is logical-mathematical by attaining Pearson correlation = 0,109. The last/seven rank is spatial-visual. This intelligence gets Pearson correlation = 0,077.

The findings shows that the  $H_0$  (null hypothesis) of the research is accepted for the majority of multiple intelligences items. In spite of some of intelligences are correlated with proposal writing score, but those are differentiated by high and low correlation calculation. By seeing the table 4.2-4.9, the researcher can know the relation of each score. It can be inferred that both of the students' multiple intelligences score and proposal writing score mostly students attain medium score as their preeminent score. Besides that, from the table 4.10-4.16 also indicate that if students' multiple intelligence score is high and students' proposal writing is high, the result of correlation is significant.

Conversely, if students' multiple intelligence is low and students' proposal writing is low, the result of correlation is not significant and the  $H_a$  (alternative hypothesis) is rejected. Thus, it means that students' multiple intelligence has no significant correlation with students proposal writing score, in the other way, students' multiple intelligence is not definitive to the students' proposal writing score. In addition, students' multiple intelligence is not able to predict students' proposal writing score.
